feeding tips for your buds

- ❗ In warmer or colder environments, please use either Liquid Heat or Liquid Ice to enable your plant to grow optimally.
- ❗ Both Liquid Heat and Liquid Ice have the technology to support your plant to grow normally when usually they would not.
- ❗ Water Saver can be used all-year round, but when used in conjunction with either Liquid Ice or Liquid Heat please reduce dilution rate by 50% for both. Never use Liquid Ice or Liquid Heat together.
- ❗ Please visit evoponic.com for further details and information on how this is unique technology to Evoponic.
- ❗ If growing in coconut coir base media, please make sure you use Magi-cal Extra.
- ❗ Maintain a nutrient PH solution between 5.5 - 6.5.
- ❗ Optimum temperature range between 20 degrees Celsius and 24 degrees Celsius. If operating outside of these temperatures please use Liquid Heat/Ice.
- ❗ Always use nutrient solution immediately or keep solution circulating to prevent settling.
- ❗ If using a recirculating system always maintain water level in reservoir by using fresh water in nutrients as needed. Please make sure you change your water every week.
- ❗ If using a drain-to-waste system allow 10-25% run-off to stop salt build up. If no run-off is planned please reduce your EC accordingly to prevent any salt build-up and blockages.
- ❗ Evoponic additives can also be added to feeding schedules. If using Bud Honey in a recirculating system please use half the dosage rate. Also only add Bud Honey once you have got your desired PPM/EC as Bud Honey can produce a false reading due to its sugar content.

Evoponic dosage rates will differ from the feeding schedule above to the directions of use noted on the bottles.

This is because evoponic additives, when used solely on their own, have different dilution rates than when used in conjunction with other evoponic products.

If in doubt, please contact evoponic customer support who will be glad to help.

VISIT EVOPONIC.COM FOR ALL THE KNOWLEDGE ON HOW WE PRODUCE AND MANUFACTURE OUR PRODUCTS.
